Silica Gel Dehumidifier Manual

Protects 57 cubic feet/1614 liters

Place unit within the enclosed space to be protected. The unit is active as long as the indicating beads remain blue. When the indicating beads turn pink, the silica gel is becoming saturated and should be reactivated. To reactivate, place the entire unit (do not disassemble) in 325 F/160 C oven for at least 3 hours. Let the unit cool just enough to handle then return to the enclosed space.

Note: the indicating beads will gradually turn blue again.
